

Bio-Box

For an efficient spreading of beneficials!

Bio-Box

Biobest's Bio-Box is a little cardboard box which can easily be hung in the crop. Several natural enemies can be put in this box. The Bio-Box is a handy tool for spreading beneficial insects in crops.

The Bio-Box is most suited for the introduction of *Orius*, *Macrolophus*, *Encarsia* (packed as loose pupae), *Eretmocerus*, *Aphidius colemani* and many other beneficials.

APPLICATION

Beneficial insects do not have to be scattered directly on the crop anymore. Use of the Bio-Box can prevent a lot of natural enemies from falling on the ground during application. Once the beneficials are situated in the Bio-Box, they will leave it and will start searching for pests. Moreover, the new Bio-Box has the advantage that beneficials can be introduced on the exact spot where biological control is urgently needed. The application of the Bio-Box is therefore very practical for controlling hot spots of harmful insects.

Thanks to these advantages, the new Bio-Box is a user-friendly and efficient system for introducing beneficial insects in the crop.
